

Briefly introduce to Milestone 3

There are two function for our milestone3, which relate to Medical treatment and public health. There are two option button in navigate bar, the background picture is a robot.

First of it is testing vocabularies for Medical treatment and public health. When we loaded the web page, there a multiple-choice test for the English and Chinese translation.

If you choose a wrong answer for one of these question, It will display which choice was incorrect and suggesting try again.

Second function is the live new for Ding Xiang Yuan which is a professional medical app in China. We run the python code to crawl all the latest news for COVID-19 in China into this web page. So user do not have to open the DINGXIANGYUAN app to obtain news for Virus. It quite convenient to obtain the information for a app.

In this milestone, we use bs to claw the real time data, using Ajax to reduce page reloading.

to implement the asynchronous function, In web, we use jquery for the website. In milestone 4 we will construct more function by using redis to store data and other api to implement more function, so our team will work more.
